## 9. Hook block and load hook

### 9.1 Minimum required hook block weight

---

#### WARNING

Falling parts and hook block!

If an insufficient hook block weight is selected, the hook block will be wrenched violently upwards by the hoist rope between jib head and winch once a certain hoist height has been reached. This could cause damage to the jib head and the hook block. Damaged parts, as well as the hoist rope between jib head and winch are susceptible to falling.

If slack rope forms between winch and jib head as the winch is being wound off, the hook block could drop without warning.

Persons could suffer serious injury or even fatalities!

- ▶ Calculate the minimum required hook block weight prior to lifting the load!
- ▶ Select the weight of the hook block dependently of the calculation!

If the weight of the hook block is insufficient:

- ▶ Select a heavier hook block or increase the weight of the hook block using slinging gear, load-carrying equipment, additional weights or conversion kits!
- 

#### CAUTION

The ropes could sustain damage due to insufficient weight of the hook block!

If the hook block is operated with a higher reeving than that required by the load on the respective jib length, the minimum required hook block weight increases.

If the hook block weight is not sufficient enough to apply the correct tension to the hoist rope, problems could arise when winding onto the winches during lifting and lowering of the hook block as a direct result of the formation of slack rope. This could cause damage to the ropes.

If no system-conditional minimum hoist rope reeving is required for the respective operating mode:

- ▶ Reeve the hook block minimally in correlation with maximum rope pull and the weight of the load being lifted!

If the weight of the hook block is insufficient:

- ▶ Select a heavier hook block or increase the weight of the hook block using slinging gear, load-carrying equipment, additional weights or conversion kits!
-

| Operating mode | Boom length [m] | Load capacity reduction [t] |

### 10.4 Load capacity reduction with mounted boom nose

10.4.1 The loads specified in the load charts for crane operation on the telescopic boom or on the lattice fly jib apply for operation without mounted boom nose.

10.4.2 If the boom nose remains mounted on the boom head during operating modes not featuring boom nose, the possible load for these operating types is reduced by:

- the weight of the boom nose
- the weight of the hoist rope reeved at the boom nose
- the weight of the load carrying gear utilised on the boom nose

| Designation                        | Weight |
|------------------------------------|--------|
| Boom nose without positioning axle | 0.9 t  |
| Boom nose with positioning axle    | 1.1 t  |

Example: If the dead weight of the single-pulley hook block with 2 mounted additional weights is 2 t and the distance between hook block and boom nose is minimal, the load is reduced by 3.3 t.

10.4.3 If there are no separate load charts for boom noses featuring a maximum load capacity of 65 t then the load charts for the main jib and auxiliary jib apply, however, the loads must be reduced by:

- the weight of the boom nose
- the weight of the hoist rope reeved at the boom nose
- the weight of the load carrying gear and lifting tackle used at the boom nose
- the weight of the load carrying gear and lifting tackle used at the jib

## **12.2 Combination of the assemblies to operating modes**

The assemblies of the boom system may be combined with each other in accordance with specific regulations regarding operating modes. See „13. *Explanation of symbols*“ on page 70.

### Additional boom operating modes with hydraulically adjustable lattice fly jib

Examples:

|     |                 |
|-----|-----------------|
| T37 | NZF<br>xx° 24.5 |
|-----|-----------------|

Left side = main boom operating mode

- Main boom type e.g.: T37 = telescopic boom (52 m) with 7 telescopic parts, but only tele 1 to tele 3 may be extended!

Right side = additional boom operating mode

- Additional boom type e.g.: NZF = hydraulically adjustable lattice fly jib
- Additional boom angle e.g.: xx° = hydraulically adjustable lattice fly jib is positioned to the telescopic boom at a fixed angle, obtained from the angle specifications in lines xx of the respective load chart.
- Additional boom length e.g.: 24.5 m

|              |                   |
|--------------|-------------------|
| T7YE<br>Y20° | VENZF<br>xx° 36.5 |
|--------------|-------------------|

Left side = main boom operating mode

- Main boom type e.g.: T7YE = telescopic boom (100 m) with 7 telescopic parts, guyed with Y-frame on the eccentric
- Angle of the Y-frame e.g.: Y20° = Y-frame position 20°

Right side = additional boom operating mode

- Additional boom type e.g.: VE = 6 m telescopic boom extension with eccentric  
e.g.: NZF = hydraulically adjustable lattice fly jib
- Additional boom angle e.g.: xx° = hydraulically adjustable lattice fly jib is positioned to the telescopic boom extension at a fixed angle, obtained from the angle specifications in lines xx of the respective load chart.
- Additional boom length e.g.: 36.5 m

Working radius symbol for additional boom operating modes with hydraulically adjustable lattice fly jib.

Working radius symbol for guyed additional boom operating modes with hydraulically adjustable lattice fly jib.

### Telescopic boom length

In the row beneath this symbol the different boom lengths of the crane are indicated in columns. The letters next to the boom symbol indicate the units of measurement in the actual load chart. E.g.: "m > < t " means that all lengths are given in meters [m] and all weights are given in metric tons [t].

CODE > 0001 <

### Short code

4-digit short code; specifies in coded form the set operating mode / current set-up stage. The short code can be entered directly into the LICCON-overload safety device to call up the respective load capacity table.

\* n \*

### Hoisting rope reeving

Appears in the load capacity tables as a line beneath the load capacity values. Indicates the number of hoist rope lines required to hoist the maximum load in the corresponding load capacity table column. If a load capacity value in the column exceeds the load which can be lifted with max. possible reeving, an exclamation mark (!) appears next to the reeving number signifying that special equipment is required to lift this load.

- Load capacities over 363 t with auxiliary device

### 14.3.3 Establishing the maximum permissible wind speed by way of wind force diagrams

The maximum permissible wind speed ( $v_{\max}$ ) for the load case can be established by way of the following wind force diagrams in correlation with the maximum permissible wind speed in accordance with the load chart ( $v_{\max\_TAB}$ ).

Arrangement of the wind force diagrams:

- **Diagram 7.0 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 7.0 m/s
- **Diagram 8.6 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 8.6 m/s
- **Diagram 9.0 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 9.0 m/s
- **Diagram 9.9 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 9.9 m/s
- **Diagram 11.1 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 11.1 m/s
- **Diagram 12.8 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 12.8 m/s
- **Diagram 14.3 m/s:** Wind force diagrams for load charts with a maximum permissible wind speed ( $v_{\max\_TAB}$ ) of 14.3 m/s

#### WARNING

Risk of accident if the wrong wind force diagrams are used!

- ▶ The maximum permissible wind speed in accordance with the load chart ( $v_{\max\_TAB}$ ) must correlate with the maximum permissible wind speed of the wind force diagram!

The following data is required for establishing:

- Maximum permissible wind speed in accordance with the load chart ( $v_{\max\_TAB}$ )
- Hoist load ( $m_H$ )
- Projection surface of hoist load ( $A_P$ )
- Wind resistance coefficient ( $c_W$ )

Process description:

- 1.) Calculation of the exposed surface ( $A_W = A_P \times c_W$ )
- 2.) Check whether exposed surface  $A_W$  exceeds the limit value of  $1.2 \text{ m}^2/\text{t}$
- 3.) Establishing the maximum permissible wind speed ( $v_{\max}$ ) from the respective wind force diagram
